Lesson #1

What is Microbiology?

Objectives:

- The learner will demonstrate knowledge of important advances in microbiology by creating a timeline of microbiological milestones.
- The learner will demonstrate application of the many milestones in microbiology by researching and reporting on the current work being done by microbiologists.

National Science Education Standards:
SAI 1, LS 1, ST 2, SPSP 5, HNS 1, HNS 2, HNS 3

Benchmarks:
1C, 1D, 2B, 3A, 3C, 7G, 10I, 12D

Materials:
- Internet access
- Student research sheets
- Books (optional)
- Colored pencils
- Timeline poster sheet

Background:
Many students are unaware of the varied areas of science. Because there is so much diversity within scientific fields, it is important for scientists to know about fields other than their own so that they can more easily communicate with other scientists. This is also important for students, as they can not only explore new areas of science, but also have an awareness of the struggles and accomplishments which have made our world what it is today.

The first part of this activity allows students to look into the roots of microbiology and see how the discipline has grown. Using a timeline format will help students to see the order in which scientific discoveries occurred, allowing them to make connections from one discovery to the next and see how these discoveries build upon each other.

In the second part of this activity, students will have the opportunity to look into the science of today. Students will be asked to focus on a specific area of microbiology. They will then be asked to find scientists who are currently doing research in their chosen area. This is important for students to see that many discoveries are being made in colleges, universities and institutes all around the world, with some near them. It is important to appreciate the achievements of all researchers who are helping to make a difference in our world, whether they are “famous” or not.

Preparation:
The preparation for this activity depends on how you will be organizing your timeline. If you have more than one class that will be working on the project, you may want to have one large timeline for all of your classes. This activity will work well no matter how long you decide
to make your timeline. You can use the list of microbiologists as a guide. If you will be working
with just one class, please consider your choice of microbiologists so that the timeline will span
the history of microbiology. There is a suggested list of microbiologists for use with single
classes.

Along with the list of microbiologists, there is also a list of six of the main areas of
microbiology. Review this list with students when they are choosing the branch of microbiology
that they will be researching.

Warm-Up:
Ask your students “What is microbiology? What do microbiologists do?” Discuss
different kinds of microorganisms and how they affect our lives.

Procedures:
1. Students will each be assigned a microbiologist to research. They will use their findings
to create a piece of the class microbiology timeline.
2. After creating the timeline pieces, students will assemble the timeline and discuss the
major milestones which they researched.
3. Students will then be asked to pick one of six different areas in microbiology. They will
use a website to gather information on that branch of microbiology and research a
scientist currently working in that area.

Variations and Follow-Up Activities:
As described in the background section, there are many options for putting the timeline
together. This may be a project using the work of students from many different classes or from
just one class. The location of this timeline will vary by teacher, but these may be displayed in
the classroom, cafeteria, hallway, or in a school display case.

Because each student will be creating his/her own piece of the timeline it is very easy to
assemble all of their pieces to make the timeline. A piece of string may be used as a “line” and
students posters may be hung on that string, or attached to the wall below the line. Alternatively,
the posters can be attached to a large piece of roll paper and displayed. The method used will
depend on the needs of the students and the locations available to you.

The activities that follow in this module will serve as a follow-up to this lesson as
students can refer back to the timeline while they are learning about specific microbial processes.

Assessments:
While constructing the timeline, students’ interpersonal skills may be observed as they
may work together in placing each of the posters chronologically on the timeline. This will
depend on the way that you structure the activity.

Students’ research skills and writing skills can be assessed through the individual
timeline pieces that the students create as well as through the “Microbiology Today” research
that they conduct and report on.

Two separate grades can be given on this assignment, one for the timeline poster and the
other for the “Microbiology Today” research sheet.
Observations:

I found that it was very helpful to have some books on hand for the research portion of this lesson. While many of my students were able to use the internet as a research tool with very little difficulty, some students found the information on the internet to be too much to look at all at once. The use of books provided a more concise format for students with perceptual difficulties as well as for my Limited English Proficiency students. It is not necessary to go out and buy special books for these students to use. Encyclopedias, comprehensive dictionaries, and printed copies of simple web pages can be a great help.

It is STRONGLY recommended that you check all websites you are planning to use with students before beginning work. The internet is ever changing and what is there one year may not be there the next. Taking a few minutes to check the sites the day before an activity can save a lot of class time if those sites are not up and running.

Consider using some examples in your classroom. I have found that my students produce a higher quality of work when an example is shown. This will give students some expectations to consider when working. I found that a sample was helpful for both the microbiologist poster and the timeline. When my students know I expect quality work from them, they don’t let me down.

You may want to consider doing some research of your own and look for microbiologists in your area. While you may not have a microbiologist next door, students can feel a sense of pride in researching a microbiologist who works in their state or region. Look to local colleges and universities for information about any microbiologists who may be of interest to your students.

The following page gives examples of some of the work which my students produced.
Jennifer Lamkie, Thomas Jefferson Middle School - Craig Phelps, Ph.D. Rutgers University
Funded by the National Science Foundation, Biocomplexity in the Environment Program, Award #0120453

Immunology
What is Microbiology?

In this activity you will be researching a microbiologist who has made an important contribution to the study of microbiology. You will then compile your findings into a data page which will be used to create a timeline of the major milestones in microbiology. Next you can choose an area of microbiology to research and find out about the scientists who are carrying on that type of research today.

Use this sheet to help you in your research before putting together your piece of the timeline. You may use books and internet sites, but you must record these sources. Here are some sites to try:
http://www.historique.net/microbes/history.html
http://www-micro.msb.le.ac.uk/109/History.html
http://www.microbes.info/resources/General_Microbiology/History/
http://www.microbeworld.org/htm/aboutmicro/timeline/tmln_0.htm

When researching your chosen area of microbiology, it is suggested that you start at http://www.microbeworld.org
